

Sprint 2 Burndown Chart

The above screenshot represents the burndown chart of our group in Sprint 2. There was an initial spike on the first day as user stories were still being added. On June 16th, an additional user story was added to Sprint 2 which is represented by the slight increase near the beginning of the sprint. The planned velocity differs from the actual velocity especially from the middle towards the end. This is due to members having to deal with multiple commitments from other courses and having to prepare for technical interviews. However, the velocity from Sprint 2 has improved from Sprint 1, this could be due to members needing more time to setup and get familiar with the project in Sprint 1. There are a few user stories that was not completed and will be moved to Sprint 3.
